

Installation Instructions for Straight and Stair Column Adaptors

Before installation, check local building code requirements. Variations in construction, weather conditions and building code requirements must be determined prior to installation to assure a secure installation.

Installation Instructions

Installation:

Step 1: Locate and mark on your posts where the brackets will be installed.

Step 2: Locate and securely mount the top and bottom Column brackets (Straight or Stair) using the 1 ½” screws provided. Each Column Adaptor requires 4-1 ½” screws. It will be helpful to drill pilot holes for the attachment screws as they may penetrate the metal post bracket in some locations.

Step 3: You may now locate your rails into the external molded brackets and assemble your rail section per instructions included with those sections – using the 2 ½” mounting screws included with the Column Adaptors (it will be helpful to drill pilot holes for the attachment screws as they may penetrate the metal post bracket in some locations). You will need to locate your rail section into the external brackets prior to installing those brackets onto the adjacent post to allow insertion of the section between the posts. The external molded brackets are designed to allow mounting after the section is located in the molded brackets.

Step 4: The bottom rail external molded bracket may be placed into the Column Adaptor bracket and securely mounted using the 4 screws provided (2 ½”). It will be helpful to drill pilot holes for the attachment screws as they may penetrate the metal post bracket in some locations.
